

File 20100523.1023: Markets are efficient at optimising around asymmetry. You know what else they are good at? Commodities that the buyer or seller does not actually have their hands on [i.e., knows the details of, e.g., a risk or risk mitigation above or outside of that accreditor's clearance or access]. Risks can add or subtract; mitigations always subtract from risk, but you may not be cleared to know how or how much or even that a particular risk is mitigated or not mitigated or partially mitigated, because the existence or knowledge of the attack may be above your clearance.
