

File 20080423.2155:

Be forceful during your *viva*. Present a strong argument. Show the examiners that you know you're right. Advocate a strong position and **defend it**.

Idea for thesis: existing product, and a new C&A process comes along. All of a sudden the existing project has got to support these new requirements. It's an example of requirements shift. What is the best practice (c.f. Requirements softeng course) for handling requirements changes late in development? Sometimes you can't say 'no' (get a waiver/increase the cost). The developer eats the cost.
