

File 20100614.1734: Notes from L-code meeting this morning:

RM 5.0 regression testing finished last week. Installation next week, followed by three weeks of government regression testing. The web GUI is now usable across the board. There are a few issues with it, but none of them are security-related, and all have workarounds.

There were 101 findings out of Beta 1 CT&E, only about 25 of which were fixed with software changes. The remaining 75 were addressed with documentation changes, were assessed as invalid, or will not be fixed. There were 22 CRs, some of which fixed multiple issues.

About 20 findings were fixed with configuration changes—that is, outside the TCB. Another 20 were documentation changes. The remainder will not be fixed. Examples of findings that will not be fixed include missing HLD, multi-factor authentication, and a better SSDD. NSA has given the developer a template to follow, but the Navy will not ever come up with the money for it.
