

File 20090211.1330: Graph of behavior b on the y -axis against security awareness α on the x -axis, showing a broad normal distribution containing most of the area under the curve $\int_{\text{awareness}} b d\alpha$ and showing the peak of the curve phase-shifting to the right as security education improves. Overlaid (summed) on the function $b(\alpha)$ is another curve showing a narrow peak on the y -axis (running from *laissez faire* to clinical paranoia) at a high level of security awareness, but trailing off on the right hand asymptote to a Zen-like state at a medium level of behavior past the peak of paranoia.

Need to redraw the following graph. See Figure 1

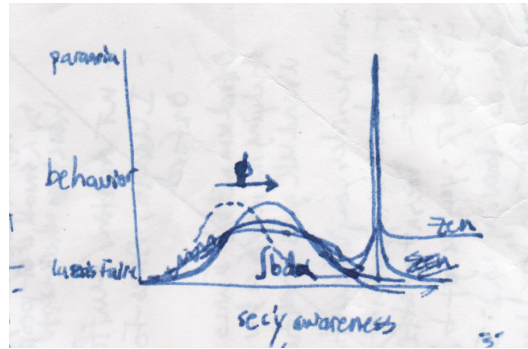

Figure 1: Security awareness.
