

File 20120209.0919: A household water heater is a cross domain system. It connects the hot water system to the cold water system; these two systems have subtly different properties and construction details (one may be insulated; the other has outside taps and is connected to the municipal supply system, etc.). *Is this one of those examples of seeing your thesis topic absolutely everywhere?*

Still no luck finding any useful information on stopping the hum from the hot water pipes. I think it might go away when the weather warms up. I wonder if a vent pipe is frozen or obstructed by a snowdrift on the roof.
