

File 20110906.0856 (BST): Notes for viva: the adjacency matrix, like the colour codes in the code book, is analysis in progress. I wasn't going to put the adjacency matrix graphs in (let the assessors think of that).

More on the grounded theory: we can work in that the same test procedures are re-tested (not just verified, but re-tested by the same people who ran them before), but that didn't come out of the grounded theory analysis. That was my own observation.

The grounded theory at present tends to support the thesis argument, but does not precisely match it. That is not surprising, as CS2 has not been mixed in yet.

I need to explain the nominal DIACAP process in Chapter 3. I need to explain the nominal CC process (as of CCv2.3) in Chapter 4.
