

File 20100907.2144: Notes for weekly activity report: I am reading *Against the Gods: The Story of Risk* because I need to know right away what ‘risk’ is. It does not seem right for risk to be a dimensionless quantity, like a probability, because like a probability, a probability is never an isolated number, it is the probability of a certain event, just as a risk is the probability of a certain event, and the cost of that event, and the cost of mitigating that risk, and the cost of not mitigating it.
