

File 20090808.2159: I'm doing it again, aren't I? Delaying progress on steps $n + 1$ *et seq.* because step n is not complete yet. Example: dithering over approvals from bosses of a notional plan of actions and milestones because some of those bosses aren't in town for a week or two. Dr Martin has cautioned against this. I need to have sideways progress planned, interim actions I can work on while waiting for some other task to complete, or I'm going to get caught the same way every time I send in a paper to an editor, 'frozen' in place, making no progress at all until the editor responds.
