

File 20100604.1823: Notes from LM VTIS this morning:

Safe Harbour refers to the fact that the EU does not consider US privacy laws adequate. Until the US fixes its laws, US companies can self-certify with the FTC, on an annual basis, and thereby be allowed to display the EU Safe Harbour credential, assuring people in Europe that their personal data will be protected. Some companies tried claiming Safe Harbour falsely, and ended up with a twenty-year injunction from the FTC. So there are some serious penalties involved.

Lockheed Martin is pursuing Safe Harbour at the moment.

The extension of *habeas corpus* to the concept of *habeas data*.
